

Esther Lara Nascimento . Jarvis Consulting

I recently graduated with a Diploma in Computer Programming from Seneca College and have been building hands-on experience through technical projects at Jarvis Consulting Group. My background includes working with Python, Java, SQL, and cloud infrastructure to build scalable applications and automated system solutions. What excites me most about the technology industry is the opportunity to solve real business problems with code and to keep learning new tools and systems. I am especially passionate about software development and system architecture because it combines creative problem-solving, scalability, and practical business impact, all supported by my foundational background in International Business Management.

Skills

Proficient: SQL (PostgreSQL), Linux/Bash Scripting, Docker, Git/GitHub, Database Design (DDL/DML), Requirements Elicitation, Process Documentation

Competent: Python, C++, JavaScript, HTML/CSS, Crontab/Automation, Tableau, React, Jira

Familiar: JSON/YAML, Docker Compose, Google Cloud Platform (GCP), Java, MongoDB

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_EstherLaraNascimento

Cluster Monitor [GitHub]: Architected and implemented a lightweight server monitoring tool using Linux Bash scripting to track system resource usage (CPU, Memory, Disk) in real-time. Configured automated data collection via Crontab scheduling to generate periodic health reports.

Highlighted Projects

Jarvis RDBMS (Relational Database): Designed and deployed a containerized PostgreSQL database for a country club management system using Docker. Architected the database schema (DDL) and managed data ingestion for members, facilities, and bookings. Engineered complex SQL queries using Joins, Aggregations, and Window Functions.

Java Grep App: Developed a Java application to search for text patterns within files recursively across directories. Leveraged Lambda expressions and the Streams API for efficient data processing, while implementing SLF4J for application logging.

Data Engineering PoC (London Gift Shop): Engineered a Proof of Concept (PoC) for a retail data pipeline using Python and Pandas. Implemented data ingestion and transformation logic to process store transactions and inventory data, creating a scalable foundation for business intelligence and reporting.

Databricks Financial ETL Pipeline: Developed a cloud-based data pipeline using the Medallion Architecture to ingest, transform, and analyze financial transaction data. Built data validation layers to ensure information reliability and created aggregate analytics dashboards for fraud pattern tracking.

Power BI Fundamentals: Developed three interactive Power BI dashboards to deliver actionable insights across sales, survey, and financial data. Built a Beverages Sales Dashboard analyzing Coca-Cola's sales and operating profit across U.S. states using AI-driven Q and A, key influencer visuals, and dynamic maps. Transformed and analyzed over 600 survey responses to create a Data Professionals Report highlighting trends in salary, job satisfaction, and in-demand skills. Designed a Stocks Dashboard by integrating Alpha Vantage API data to visualize historical prices, trading volume, key financial metrics, and earnings estimates. Performed data cleaning, transformation, and modeling, validated outputs, and translated complex data into clear, data-driven business insights.

PySpark: Designed and deployed four comprehensive ETL pipelines within the Databricks platform using PySpark to ingest and process data from diverse sources, including REST APIs, PostgreSQL databases (via JDBC), and internal Hive tables. Developed data manipulation logic such as three-way joins and time-series aggregations to derive business-critical metrics, while optimizing storage and query performance through the use of Parquet and Delta Lake formats. Engineered data partitioning strategies to enable efficient partition pruning, significantly reducing I/O overhead and execution time for downstream analytics. Managed real-world data engineering challenges, including handling API rate limits and ensuring schema consistency across heterogeneous data environments to deliver production-ready data assets.

BSA Fundamentals: Structured and executed a comprehensive BSA project centered on deconstructing complex product requests into clear, actionable business objectives. By performing detailed requirements analysis, business needs were

successfully separated from technical constraints, allowing high-level goals to be translated into specific functional and non-functional specifications. The project involved simulating stakeholder engagement through a dedicated requirements elicitation process and interactive presentations to document critical assumptions and clarifications, ensuring the completeness of the system's scope. This process culminated in the production of professional BRD and SRD-style documentation, demonstrating a strong ability to communicate business logic, data requirements, and intended system behavior to both technical and non-technical audiences.

Professional Experiences

Business Systems Analyst, Jarvis Consulting (2026 - present): Collaborate with stakeholders and developers to translate high-level business needs into detailed functional and non-functional requirements for analytics and infrastructure projects. Lead the end-to-end design of Power BI dashboards, managing everything from SQL data modeling to UI development to provide e-commerce clients with actionable sales and operational insights. Support the full project lifecycle by performing data validation, mapping system workflows, and maintaining comprehensive documentation, including BRDs and process diagrams. By bridging the gap between business goals and technical execution across Linux and Python-based environments, ensure all solutions deliver accurate, reliable, and data-driven results.

Assistant Accountant, Construtora Vale do Ouro (2017 - 2019): Collaborated directly with the CEO and senior engineering teams to gather requirements across departments and turn complex financial data into clear insights that helped everyone make better business decisions. I was the go-to person for multiple stakeholders, proactively presenting reports and keeping the lines of communication open across the company. I also teamed up with the rest of the finance department to double-check our validation processes, making sure our data was always reliable and accurate. Beyond reporting, I handled tax filings and looked for ways to make our daily workflows smoother for the whole team..

Education

Seneca College (2023 - 2025), Diploma in Computer Programming, School of Information Technology - Relevant Coursework: Object-Oriented Programming (C++, Java), Database Design (SQL). - Applied SDLC principles to design and deploy scalable applications. - Gathered and analyzed document requirements for software projects to define clear project scopes. - Collaborated with team members to document user needs and map out system workflows for course assignments. translate project needs into clear documentation.

Greystone College (2020 - 2022), Diploma in International Business Management Co-Op, Business Department - Gained a comprehensive understanding of business operations and management. - Enhanced communication and leadership skills within a diverse business environment.

Miscellaneous

- Fluent in Portuguese and English
- Plant Care Enthusiast (Monstera, ZZ Plants)
- Continuous Learner
- Team Player
- Problem Solver
